“Fundamentals of Database Systems”  
7<sup>th</sup> Edition., Pearson, 2017

# Chapter 7

mobify ໂຄສະນາລອກນີ້

More SQL:

Complex Queries, Views, and Schema Modification

# Outline

- More Complex SQL Retrieval Queries
- Views (Virtual Tables) in SQL
- Schema Modification in SQL

# More Complex SQL Retrieval Queries

- Additional features allow users to specify more complex retrievals from database:

- Nested queries, query ที่อยู่ query gran IN , AND 9 ใน WHERE<sup>query ที่อยู่ query gran IN , AND 9 ใน WHERE</sup>
- <sup>NATURAL JOIN / INNER JOIN</sup> joined tables, and outer joins (in the FROM clause),<sup>left , right 9 ที่อยู่ from</sup>
- aggregate functions, and<sup>ฟังก์ชันคำนวณ เช่น [ SUM( column ), AVG( column ), COUNT( column ), MAX( ... ), MIN( ... ) ]</sup>
- grouping<sup>การจัดกลุ่ม ตามค่าของ column ที่ต้องการ</sup>  
<sup>ก่อนหน้า aggregate function</sup>

# Comparisons Involving NULL and Three-Valued Logic

- Meanings of **NULL**
  - Unknown value មិនដូចគ្នា
  - Unavailable or withheld value មិនអាចបង្កើតបាន
  - Not applicable attribute នៅពេលកែតាមរយៈការណ៍ មិនអាចបង្កើតបាន (ត្រូវបានកែតាមការពិនិត្យ NULL ទេ)
- Each individual NULL value considered to be different from every other NULL value
- SQL uses a three-valued logic:
  - **TRUE**, **FALSE**, and **UNKNOWN** (like Maybe)
- **NULL = NULL** comparison **is avoided**

មិនអាចបង្កើតបាន

**Table 7.1** Logical Connectives in Three-Valued Logic

(a)	AND	TRUE	FALSE	UNKNOWN
	TRUE	TRUE	FALSE	UNKNOWN
	FALSE	FALSE	FALSE	FALSE
	UNKNOWN	UNKNOWN	FALSE	UNKNOWN

(b)	OR	TRUE	FALSE	UNKNOWN
	TRUE	TRUE	TRUE	TRUE
	FALSE	TRUE	FALSE	UNKNOWN
	UNKNOWN	TRUE	UNKNOWN	UNKNOWN

(c)	NOT	TRUE	FALSE	UNKNOWN
	TRUE	FALSE	TRUE	UNKNOWN
	FALSE	TRUE	FALSE	UNKNOWN
	UNKNOWN	UNKNOWN	UNKNOWN	UNKNOWN

↑  
in 2 in True = True

↑  
False True = True

↑  
UNKNOWN

- SQL allows queries that check whether an attribute value is NULL
  - IS or IS NOT NULL

Check តារាង Null នេះ

ត្រូវ

ការបង្កើតអង្គភាព

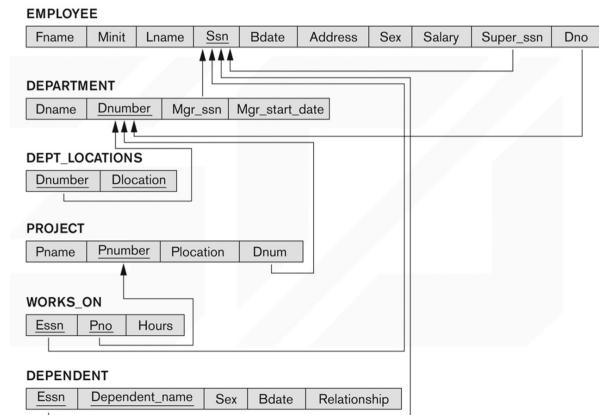

**Query 18.** Retrieve the names of all employees who do not have supervisors.

**Q18:**    **SELECT**      Fname, Lname  
              **FROM**        EMPLOYEE  
              **WHERE**      Super\_ssn **IS NULL;**

# Nested Queries, Tuples, and Set/Multiset Comparisons

- **Nested queries** ការ query នៃ sub query ។  
 • Complete select-from-where blocks within WHERE clause of another query
- **Outer query and nested subqueries**
- Comparison operator **IN** រាយការណ៍ទីនៃ set និង multiset  
 • Compares value  $v$  with a set (or multiset) of values  $V$
- Evaluates to TRUE if  $v$  is one of the elements in  $V$

ធនធាន query គឺមាន នឹង set ឬ multiset  
 - សមត្ថភាព 1 = ឱ្យក្នុង  
 - ចំណាំ IN

Q4A: **SELECT  
FROM  
WHERE**

**DISTINCT Pnumber**

**PROJECT**

**Pnumber IN**

**( SELECT  
FROM  
WHERE**

**OR /UNION**

**Pnumber IN**

**( SELECT  
FROM  
WHERE**

**Pnumber  
PROJECT, DEPARTMENT, EMPLOYEE  
Dnum=Dnumber AND  
Mgr\_ssn=Ssn AND Lname='Smith' )**

**Pno  
WORKS\_ON, EMPLOYEE  
Essn=Ssn AND Lname='Smith' );**

Select the project number of projects that have an employee with last name 'Smith' involved as **manager**.

Select the project number of projects that have an employee with last name 'Smith' involved as **worker**.

tuple values ↗

- Use tuples of values in comparisons
  - Place them within parentheses

```
SELECT      DISTINCT Essn
FROM        WORKS_ON
WHERE       (Pno, Hours) IN ( SELECT      Pno, Hours
                                FROM        WORKS_ON
                                WHERE       Essn='123456789' );
```

Select the ESSN of all employees who work the same (project, hours) combination on some project that employee 'John Smit' (whose SNN = '123456789') works on.

- Use other comparison operators to compare a single value  $v$ 
  - = ANY (or = SOME) operator *o និងរាយ អេក្រង់ = មែនត្រូវ*
    - Returns TRUE if the value  $v$  is equal to some value in the set  $V$  and is hence equivalent to IN
  - Other operators that can be combined with ANY (or SOME):  $>$ ,  $\geq$ ,  $<$ ,  $\leq$ , and  $\neq$
  - ALL: value must exceed all values from nested query

```

SELECT      Lname, Fname
FROM        EMPLOYEE
WHERE       Salary > ALL
            ( SELECT      Salary
              FROM        EMPLOYEE
              WHERE       Dno=5 );
    
```

ANY  
និងរាយ  
អេក្រង់  
> មុនពេល

Return the name of employees whose salary is greater than the salary of all the employees in department 5.

- Avoid potential errors and ambiguities
  - Create tuple variables (aliases) for all tables referenced in SQL query

☞ ສູງ dependent ກ່າວເອົາກັກ

**Query 16.** Retrieve the name of each employee who has a dependent with the same first name and is the same sex as the employee.

Q16:    **SELECT**      E.Fname, E.Lname  
           **FROM**        EMPLOYEE AS E      rename    ເພື່ອການສືບຕາມ  
           **WHERE**      E.Ssn IN ( **SELECT**      Essn  
                         **FROM**        DEPENDENT AS D  
                         **WHERE**      E.Fname=D.Dependent\_name  
                         **AND**        E.Sex=D.Sex );

⇒ 2-3 ສູນ ວິວດະ

# Correlated Nested Queries

ច្បាប់ IN កិច្ចរួមអង្គភាព AND ក្នុង

- **Queries that are nested using the = or IN comparison operator** can be collapsed into one single block: E.g., Q16 can be written as:

Q16

```
SELECT E.Fname, E.Lname
FROM EMPLOYEE AS E
WHERE E.Ssn IN ( SELECT Essn
                  FROM DEPENDENT AS D
                  WHERE E.Fname=D.Dependent_name
                        AND E.Sex=D.Sex );
```

**Q16A:**

**SELECT** E.Fname, E.Lname  
**FROM** EMPLOYEE **AS E** , DEPENDENT **AS D**  
**WHERE** E.Ssn = D.Essn  
                  { **AND** E.Sex = D.Sex  
                  **AND** E.Fname = D.Dependent\_name;

នំនែនទៅ

- **Correlated** nested query  
ជាមួយនឹង នំនែនទៅ tuple នៃ outer query
- Evaluated once for each tuple in the outer query

# The EXISTS and UNIQUE Functions in SQL for correlating queries

- **EXISTS** function *ການສອບ ຕົວການທີ່  
ມີຕົວກັງນີ້ແນວດີ*
  - Check whether the result of a correlated nested query is empty or not. They are Boolean functions that return a TRUE or FALSE result.
- **EXISTS** and **NOT EXISTS**
  - Typically used in conjunction with a correlated nested query
- SQL function **UNIQUE (Q)**
  - Returns TRUE if there are no duplicate tuples in the result of query Q  
*false ໃນດູ duplicate*

**Q16B:** Retrieve the name of each employee who has a dependent with the same first name and is the same sex as the employee.

**SELECT** Fname, Lname  
**FROM** Employee **AS** E  
**WHERE** EXISTS ( **SELECT** \*  
                        **FROM** DEPENDENT **AS** D  
                        **WHERE** E.Ssn = D.Essn **AND**  
                        E.Sex = D.Sex **AND**  
                        E.Firstname = D.Dependent\_name );

ค้นพบ

**Q6:** Retrieve the names of employees who have no dependents.

```
SELECT Fname, Lname
FROM Employee AS E
WHERE NOT EXISTS ( SELECT *
                    FROM DEPENDENT
                    WHERE Ssn = Essn      );
```

ไม่มีเดpenent .....

ค้นพบ

ສູນເປັນສອນ ສໍາເລັດກາເນື້ນ ດັວກໂຫຼວງ ອົບປະກຳເຈົ້າໄວ້ໃນນີ້

**Q7:** List the names of managers who have at least one dependent.

```
SELECT Fname, Lname  
FROM Employee  
WHERE EXISTS (
```

ມີຕົວຢູ່ ຂໍເພີ້ມທີ່ຂອງ ໄກສະ

```
    SELECT *  
    FROM DEPENDENT  
    WHERE Ssn = Essn )
```

Select all DEPENDENT tuples related to an EMPLOYEE

AND  
EXISTS

(

ກົດ SSN ມາ

```
    SELECT *  
    FROM Department  
    WHERE Ssn = Mgr_Ssn )
```

Select all DEPARTMENT tuples managed by the EMPLOYEE

```
SELECT E.Fname, E.Lname , ALL DE , ALL D  
FROM EMPLOYEE AS E, DEPENDENT AS DE,DEPARTMENT AS D  
WHERE E.Ssn = DE.Essn AND E.Ssn = D.Mgr-Ssn
```

ກົດ manager

# Explicit Sets and Renaming of Attributes in SQL

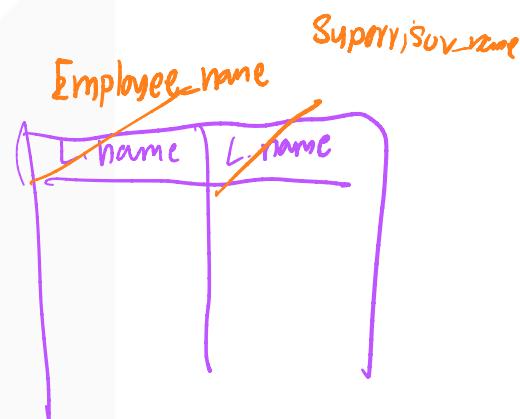

- Can use explicit set of values in WHERE clause

**Q17:**

```

SELECT      DISTINCT Essn
FROM        WORKS_ON
WHERE       Pno IN (1, 2, 3);  

               o ეგნ 1 or 2 or 3
ესნის 1, 2, 3
  
```

- Use qualifier AS followed by desired new name
  - Rename any attribute that appears in the result of a query

**Q8A:**

```

SELECT      E.Lname AS Employee_name, S.Lname AS Supervisor_name
FROM        EMPLOYEE AS E, EMPLOYEE AS S
WHERE       E.Super_ssn=S.Ssn;
  
```

# Specifying Joined Tables in the FROM Clause of SQL

ដីលិចនា Natural Join

- **Joined table** ឱវតាប់លិចនាលើការរួមចំណែកពីពាណិជ្ជកម្មទាំងអស់

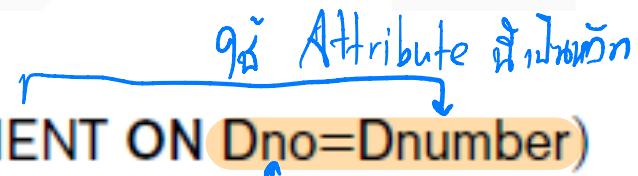

• Permits users to specify a table resulting from a join operation in the FROM clause of a query  
ឯុទ្ធសាស្ត្រ ទាន់នឹងរាយការណ៍

- The FROM clause in Q1A

• Contains a single joined table.

JOIN may also be called INNER JOIN

Q1A: **SELECT** Fname, Lname, Address  
**FROM** (EMPLOYEE JOIN DEPARTMENT ON Dno=Dnumber)  
**WHERE** Dname='Research';

q.v Attribute ដែលបាន  

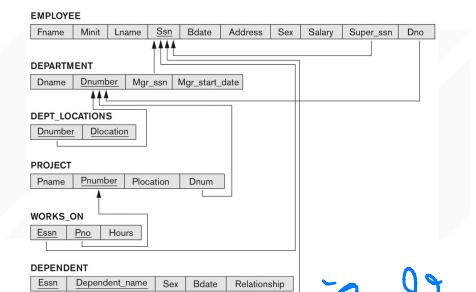

# Different Types of JOINed Tables in SQL

- Specify different types of join
  - NATURAL JOIN
  - Various types of OUTER JOIN (LEFT, RIGHT, FULL )
- NATURAL JOIN on two relations R and S
  - No join condition specified
  - Is equivalent to an implicit EQUIJOIN condition for each pair of attributes with same name from R and S

join ចំណាំ  
full join, left join, right join

Attribute ផ្លូវលក្ខណៈនៃ join

# NATURAL JOIN

อยู่ 1 table นี่อ ก็สามารถ จับ ร่องรอย ทาง ไป ได้

- Rename attributes of one relation so it can be joined with another using **NATURAL JOIN**: นามสกุล Attribute ดูในส่วนที่ 102&7 = ก็

**Q1B:**

```

SELECT Fname, Lname, Address
FROM (
    EMPLOYEE NATURAL JOIN
    (
        DEPARTMENT AS
        DEPT (Dname, Dno, Mssn, Msdate) )
    )
WHERE Dname='Research'; ใช้ชื่อ งาน บริษัท นี้
  
```

The above works with **EMPLOYEE.Dno = DEPT.Dno** as an implicit join condition

Full join ท.ซ้าย  $\longleftrightarrow$  ท.ขวา  
โดยรวมจะมีทั้งคู่

# INNER and OUTER Joins

- INNER JOIN (versus OUTER JOIN)
  - Default type of join in a joined table ผู้อธิบาย: ลักษณะ tuple ทางที่ 1 ให้ก็ต้องมี tuple ทางที่ 2 ให้ด้วย
  - Tuple is included in the result only if a matching tuple exists in the other relation
- LEFT OUTER JOIN หมายเหตุ:  $\leftarrow$  Attributes ที่ไม่ใช้ส่วนของ relation ทางขวา
  - Every tuple in left table must appear in result
  - If no matching tuple คำอธิบาย: ให้เป็น NULL ของ right table
    - Padded with NULL values for attributes of right table
- RIGHT OUTER JOIN หมายเหตุ:  $\leftarrow$  คำอธิบาย: A. ก่อนมีผลกับ ท.ซ้าย ตามลำดับ
  - Every tuple in right table must appear in result
  - If no matching tuple คำอธิบาย: ให้เป็น NULL ของ left table
    - Padded with NULL values for attributes of left table

## ສຳເນົາງູປ

# Aggregate Functions in SQL

ສູນປັບປຸງຕາມແຫດ tuple ກວດວິທະນາກສົນ 1 tuple ທີ່ສູນປັບປຸງ

- Used to summarize information from multiple tuples into a single-tuple summary
- Built-in aggregate functions
  - COUNT**, **SUM**, **MAX**, **MIN**, and **AVG**
- Grouping**
- Create subgroups of tuples before summarizing
- To select entire groups, **HAVING clause** is used
- Aggregate functions can be used in the **SELECT clause** or in a **HAVING clause** → ເພີ້ມຂໍ້ມູນໃຫຍ່ອາກຸນ (group)  
ແນວໃຈ where

sum( ) 100 Null ຈົດລົງ  
count(ກົດລົງ)

# Renaming Results of Aggregation

- Following query returns a single row of computed values from EMPLOYEE table:

Salary	...	...	...

**Q19:** `SELECT SUM (Salary), MAX (Salary), MIN (Salary), AVG (Salary)  
FROM EMPLOYEE;`

- The result can be presented with new names:

សរុប ខ្លួន ឱ្យ ឈើ ឯក ធន ឯក

tw	Hi	Lo	N

**Q19A:** `SELECT SUM (Salary) AS Total_Sal, MAX (Salary) AS Highest_Sal,  
MIN (Salary) AS Lowest_Sal, AVG (Salary) AS Average_Sal  
FROM EMPLOYEE;`

ຫົວ NULL ດ້ວຍລູກ ອະທິນໄລວ

- NULL values are discarded when aggregate functions are applied to a particular column

**Query 20.** Find the sum of the salaries of all employees of the ‘Research’ department, as well as the maximum salary, the minimum salary, and the average salary in this department.

```
Q20:   SELECT      SUM (Salary), MAX (Salary), MIN (Salary), AVG (Salary)
          FROM        (EMPLOYEE JOIN DEPARTMENT ON Dno=Dnumber)
          WHERE       Dname='Research';
```

**Queries 21 and 22.** Retrieve the total number of employees in the company (Q21) and the number of employees in the ‘Research’ department (Q22).

```
Q21:   SELECT      COUNT (*)
          FROM        EMPLOYEE;
```

```
Q22:   SELECT      COUNT (*)
          FROM        EMPLOYEE, DEPARTMENT
          WHERE       DNO=DNUMBER AND DNAME='Research';
```

# Aggregate Functions on Booleans

- **SOME** and **ALL** may be applied as functions on Boolean Values. *ເຊື້ອນວິທີ 1 ອົບ*
  - **SOME** returns true if **at least one element** in the collection is TRUE (similar to OR)
  - **ALL** returns true if **all of the elements** in the collection are TRUE (similar to AND)

# Grouping: The GROUP BY Clause

ក្រុមសម្រួល

- **Partition** relation into subsets of tuples
  - Based on grouping attribute(s)
  - Apply function to each such group independently
- **GROUP BY clause**
  - Specifies grouping attributes
- COUNT (\*) counts the number of rows in the group

ការដំឡើង

បញ្ជីរូប

# Examples of GROUP BY

- The grouping attribute must appear in the SELECT clause:

**Q24:** **SELECT** Dno, **COUNT** (\*), **AVG** (Salary)  
**FROM** EMPLOYEE  
**GROUP BY** Dno;

Dno	Count (n)	Salary
1	10	15,000
2	50	20,705
3	...	.....

- If the grouping attribute has NULL as a possible value, then a separate group is created for the null value (e.g., null Dno in the above query)
- GROUP BY may be applied to the result of a JOIN:

**Q25:** **SELECT** Pnumber, Pname, **COUNT** (\*)  
**FROM** PROJECT, WORKS\_ON  
**WHERE** Pnumber=Pno → ② mistakes  
**GROUP BY** Pnumber, Pname;

PROJECT JOIN WORK\_ON ON Pnumber = Pno

P.number	P.name	Count
1	m	10
2	m	20
3	m	30

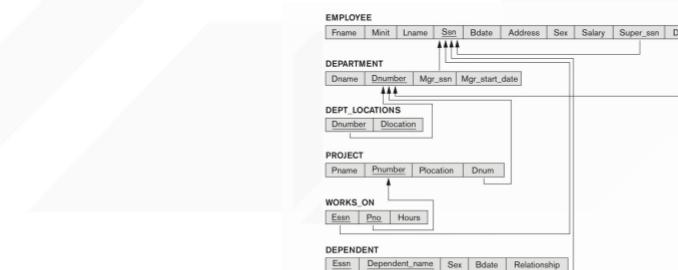

- **HAVING clause**
  - Provides a condition to select or reject an entire group:
- **Query 26.** For each project on which more than two employees work, retrieve the project number, the project name, and the number of employees who work on the project.

**Q26:**

<b>SELECT</b>	Pnumber, Pname, <b>COUNT (*)</b>
<b>FROM</b>	PROJECT, WORKS_ON
<b>WHERE</b>	Pnumber=Pno
<b>GROUP BY</b>	Pnumber, Pname
<b>HAVING</b>	<b>COUNT (*) &gt; 2;</b>

↓ where / having

P.num	p.name	Count of em

project

work\_on

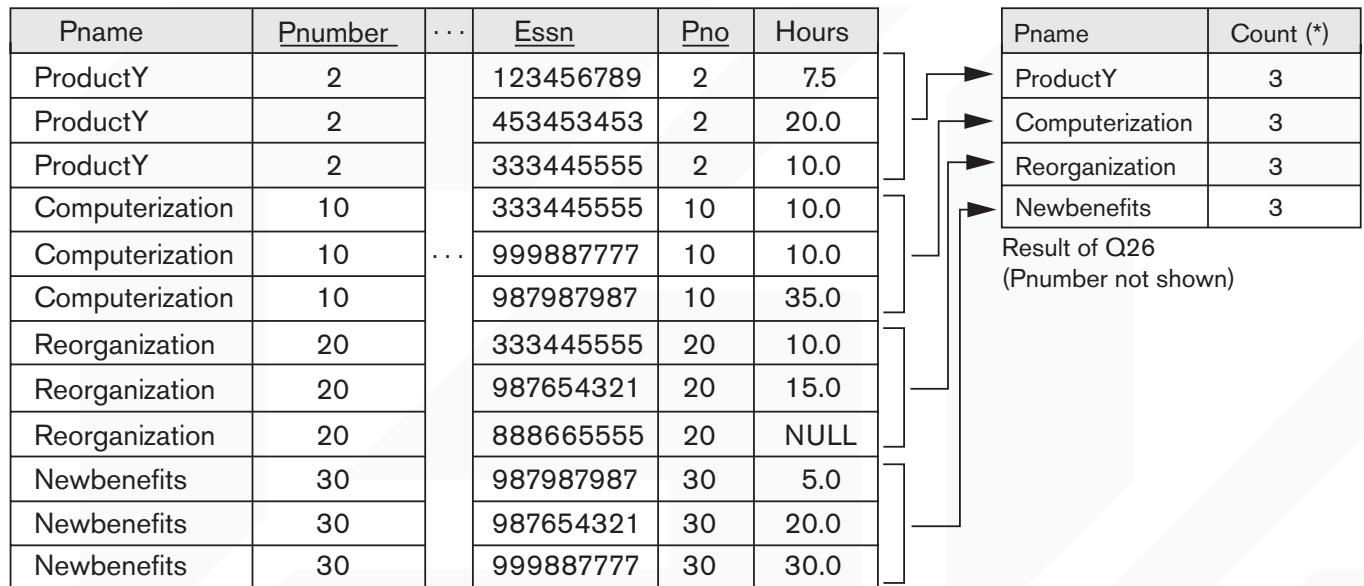

non HAVING

Pname	Pnumber	...	Essn	Pno	Hours
ProductX	1	...	123456789	1	32.5
ProductX	1		453453453	1	20.0
ProductY	2		123456789	2	7.5
ProductY	2		453453453	2	20.0
ProductY	2		333445555	2	10.0
ProductZ	3		666884444	3	40.0
ProductZ	3		333445555	3	10.0
Computerization	10		333445555	10	10.0
Computerization	10		999887777	10	10.0
Computerization	10		987987987	10	35.0
Reorganization	20		333445555	20	10.0
Reorganization	20		987654321	20	15.0
Reorganization	20		888665555	20	NULL
Newbenefits	30		987987987	30	5.0
Newbenefits	30		987654321	30	20.0
Newbenefits	30		999887777	30	30.0

These groups are not selected by the HAVING condition of Q26.

After applying the WHERE clause but before applying HAVING

# ห้อง HAVING

The diagram illustrates the execution flow of a query involving a HAVING clause. It starts with a primary table on the left, which is joined with a secondary table on the right. The result of this join is then processed by a HAVING clause, which filters the data to produce the final result table on the far right.

Pname	<u>Pnumber</u>	...	<u>Essn</u>	<u>Pno</u>	Hours	...	Pname	Count (*)
ProductY	2	...	123456789	2	7.5	...	ProductY	3
ProductY	2	...	453453453	2	20.0	...	Computerization	3
ProductY	2	...	333445555	2	10.0	...	Reorganization	3
Computerization	10	...	333445555	10	10.0	...	Newbenefits	3
Computerization	10	...	999887777	10	10.0	...		
Computerization	10	...	987987987	10	35.0	...		
Reorganization	20	...	333445555	20	10.0	...		
Reorganization	20	...	987654321	20	15.0	...		
Reorganization	20	...	888665555	20	NULL	...		
Newbenefits	30	...	987987987	30	5.0	...		
Newbenefits	30	...	987654321	30	20.0	...		
Newbenefits	30	...	999887777	30	30.0	...		

Result of Q26  
(Pnumber not shown)

After applying the HAVING clause condition

# Combining the WHERE and the HAVING Clause

↳ ធ្លាប់ពីទាំងគោរព / row / រាយការ

ក្នុង group នូវ group

- Consider the query: we want to count the *total* number of employees whose salaries exceed \$40,000 in each department, but only for departments where more than five employees work.
- INCORRECT QUERY:**

```
SELECT Dno, COUNT (*)  
FROM EMPLOYEE  
WHERE Salary > 40000  
GROUP BY Dno  
HAVING COUNT (*) > 5;
```

ចំនួន  
សម្រាប់ក្រុងក្រុង Department  
រាយការណ៍

## Correct Specification of the Query:

- Note: the WHERE clause applies tuple by tuple whereas HAVING applies to entire group of tuples

**Query 28.** For each department that has more than five employees, retrieve the department number and the number of its employees who are making more than \$40,000.

Q28: **SELECT** Dnumber, COUNT (\*)  
**FROM** DEPARTMENT, EMPLOYEE  
**WHERE** Dnumber=Dno **AND** Salary>40000 **AND** ② **จำนวน**  
( **SELECT** Dno  
**FROM** EMPLOYEE  
**GROUP BY** Dno  
**HAVING** COUNT (\*) > 5) ① **query making**  
**จำนวน**  
**ใน department**  
**ที่มาก**

# EXPANDED Block Structure of SQL Queries

คำสั่ง SQL

```
SELECT <attribute and function list>
FROM <table list>
[ WHERE <condition> ]
[ GROUP BY <grouping attribute(s)> ]
[ HAVING <group condition> ]
[ ORDER BY <attribute list> ];
```

# Views (Virtual Tables) in SQL

ក្រុមហ៊ែន រាយកីទាំងអេឡិចតាមណ៍

- Concept of a view in SQL
  - Single table derived from other tables called the **defining tables**
  - Considered to be a virtual table that is not necessarily populated

ກົດ view

# Specification of Views in SQL

## • CREATE VIEW command

ສໍາຄັນ: {  
- ອີເມວິວ: group ກອງ Apn ຢ່າວ  
- ວິເຄາະ ກອງ user ຢ່າວ  
- ວິເຄາະ version ກອງ SW ຢ່າວ

- Give table name, list of attribute names, and a query to specify the contents of the view
- In V1, attributes retain the names from base tables. In V2, attributes are assigned names

V1: CREATE VIEW WORKS\_ON1 ← ພົມວິວກະທິນ table ສໍາລັບ "WORKS\_ON1"  
ເກີນໃຫຍ່ AS SELECT Fname, Lname, Pname, Hours  
FROM EMPLOYEE, PROJECT, WORKS\_ON  
WHERE Ssn=Essn AND Pno=Pnumber;

V2: CREATE VIEW DEPT\_INFO(Dept\_name, No\_of\_emps, Total\_sal)  
AS SELECT Dname, COUNT (\*), SUM (Salary)  
FROM DEPARTMENT, EMPLOYEE  
WHERE Dnumber=Dno  
GROUP BY Dname;

# MySQL View

- Once a View is defined, SQL queries can use the View relation in the FROM clause
- View is always up-to-date
  - Responsibility of the DBMS and not the user
- DROP VIEW** command 
  - Dispose of a view

# View Implementation, View Update, and Inline Views

គម្រោងចំណាំ ផ្លាស់

- Complex problem of efficiently implementing a view for querying  
*data នឹងកើតឡើងពី Query ដែលត្រូវបានរក*
- **Strategy 1: Query modification approach**

Compute ធំទៀតទៅការណី

queries នាមីត្រូវ base table

សំខាន់ - មិនអាចប្រើប្រាស់រាយការណីក្នុង complex queries

ក្នុងវាទិញ - ក្នុងវាទិញ

នៃការរកស្នើសុំ

ឈ្មោះកើតឡើង

• Compute the view as and when needed. Do not store permanently

• Modify view query into a query on underlying base tables

• **Disadvantage:** inefficient for views defined via complex queries that are time-consuming to execute

စုစုပေါ်မှာ မျက်နှာတဲ့ အကြောင်းအရာ ဘုရား

ပံ့ပိုး

- **Strategy 2: View materialization** ခုံကြော် query → ဆုံးဖိုးစွဲတော်းခြားထွက်ပေါ် base , သူ view
  - Physically create a temporary view table when the view is first queried ပုံးမှာ view တွေ ဘေးတဲ့ စွဲတော်းခြားထွက်ပေါ် မှာ ပေါ်ပေါ်မှာ
  - Keep that table on the assumption that other queries on the view will follow ပုံးမှာ ခုံကြော် ဘေးတဲ့ စွဲတော်းခြားထွက်ပေါ် မှာ update
  - Requires efficient strategy for automatically updating the view table when the base tables are updated
- **Incremental update strategy for materialized views**
  - DBMS determines what new tuples must be inserted, deleted, or modified in a materialized view table

## ການຝຶກ

- Multiple ways to handle materialization:

ອັນດັບ view ຜົນເສີອີກ base table ສໍາງໃໝ່ຕະຫຼາມ (materialization)

- **immediate update strategy** updates a view as soon as the base tables are changed
- **lazy update strategy** updates the view when needed by a view query ດ້ວຍສ່ວນການປິດຕາມ ກີ່ຂໍ້ມູນເກົ່າ, ດ້ວຍການຖືກວ່າຍຸດໃຈບໍ່ຢັບປັດຕາມ
- **periodic update strategy** updates the view periodically (in the latter strategy, a view query may get a result that is not up-to-date). This is commonly used in Banks, Retail store operations, etc.

# View Update

ใน table เดียว ไม่มี aggregate function

- Update on a view defined on a single table without any aggregate functions

**Q** • Can be mapped to an update on underlying base table?  
 Ans - possible if the primary key is preserved in the view

- Update not permitted on aggregate views. E.g.,

**UV2: UPDATE**

**SET**

**WHERE**

**DEPT\_INFO**

Total\_sal=100000

Dname='Research';

V2: CREATE VIEW DEPT\_INFO(Dept\_name, No\_of\_emps, Total\_sal)  
 AS SELECT Dname, COUNT (\*), SUM (Salary) FROM DEPARTMENT, EMPLOYEE  
 WHERE Dnumber=Dno GROUP BY Dname;

update view

preserves primary key

preserves primary key

preserves primary key

preserves primary key

cannot be processed because **Total\_sal** is a **computed value** in the view definition

- **View involving joins** ມາຈົນສ່ວນ ຕັ້ງເຖິງຈິບນູ້ລື່ອງ ປົກປະການ
  - Often not possible for DBMS to determine which of the updates is intended
- Clause **WITH CHECK OPTION** *check ນາຍົກຕົວ* *ທີ່ „ ” ມີຄວາມຄຸງ*
  - Must be added at the end of the view definition if a view is to be updated to make sure that tuples being updated stay in the view  
*ໃຫ້ກົດກົດຕົວທີ່ tuple ອີເວັບໄວ້ຢູ່ໃນ view*

# Views as authorization mechanism

(มีประโยชน์)

- SQL query authorization statements (**GRANT** and **REVOKE**) are described in detail in Chapter 30
- Views can be used to hide certain attributes or tuples from unauthorized users
- E.g., For a user who is only allowed to see employee information for those who work for department 5, he may only access the view **DEPT5EMP**:

```
CREATE VIEW DEPT5EMP AS
SELECT *
FROM EMPLOYEE
WHERE Dno = 5;
```

# Schema Change Statements in SQL

- **Schema evolution commands**

- DBA may want to change the schema while the database is operational
- Does not require recompilation of the database schema

# The DROP Command

- **DROP command**
  - Used to drop named schema elements, such as tables, domains, or constraint
- **Drop behavior options:**
  - CASCADE and RESTRICT
- **Example:** ក្នុង DB ត្រូវបានលើកឡើង ដោយ
  - DROP SCHEMA COMPANY CASCADE;
  - This removes the schema and all its elements including tables, views, constraints, etc.

# The ALTER table command

မျဉ်းချုပ်

- **Alter table actions** include:

- Adding or dropping a column (attribute)
- Changing a column definition
- Adding or dropping table constraints

- Example:

- ALTER TABLE COMPANY.EMPLOYEE ADD COLUMN Job  
VARCHAR(12);

မှတ်

အိမ်  
နှစ်

# Adding and Dropping Constraints

អ្នកឈ្មោះ

- Change constraints specified on a table
  - Add or drop a named constraint

```
ALTER TABLE COMPANY.EMPLOYEE  
DROP CONSTRAINT EMPSUPERFK CASCADE;
```

នប

កំណត់សំគាល់អង្គភាព និងការកូល

# Dropping Columns, Default Values

- **To drop a column**

- Choose either **CASCADE** or **RESTRICT**
- **CASCADE** would drop the column from views etc.  
**RESTRICT** is possible if no views refer to it.

ADD

**ALTER TABLE COMPANY.EMPLOYEE DROP COLUMN Address CASCADE;**

- Default values can be dropped and altered :

**ALTER TABLE COMPANY.DEPARTMENT ALTER COLUMN Mgr\_ssn **DROP DEFAULT**;**

**ALTER TABLE COMPANY.DEPARTMENT ALTER COLUMN Mgr\_ssn **SET DEFAULT** '333445555';**

# Table 7.2 Summary of SQL Syntax

សំណង់ការណ៍អាជីវកម្ម

**Table 7.2** Summary of SQL Syntax

---

```
CREATE TABLE <table name> ( <column name> <column type> [ <attribute constraint> ]
    { , <column name> <column type> [ <attribute constraint> ] }
    [ <table constraint> { , <table constraint> } ] )
```

---

```
DROP TABLE <table name>
```

---

```
ALTER TABLE <table name> ADD <column name> <column type>
```

---

```
SELECT [ DISTINCT ] <attribute list>
```

---

```
FROM ( <table name> { <alias> } | <joined table> ) { , ( <table name> { <alias> } | <joined table> ) }
[ WHERE <condition> ]
```

---

```
[ GROUP BY <grouping attributes> [ HAVING <group selection condition> ] ]
```

---

```
[ ORDER BY <column name> [ <order> ] { , <column name> [ <order> ] } ]
```

---

```
<attribute list> ::= ( * | ( <column name> | <function> ( ( [ DISTINCT ] <column name> | * ) ) )
    { , ( <column name> | <function> ( ( [ DISTINCT ] <column name> | * ) ) ) } )
```

---

```
<grouping attributes> ::= <column name> { , <column name> }
```

---

```
<order> ::= ( ASC | DESC )
```

---

```
INSERT INTO <table name> [ ( <column name> { , <column name> } ) ]
```

---

```
( VALUES ( <constant value> , { <constant value> } ) { , ( <constant value> { , <constant value> } ) }
```

---

```
| <select statement> )
```

---

**Table 7.2** Summary of SQL Syntax

---

DELETE FROM <table name>

[ WHERE <selection condition> ]

---

UPDATE <table name>

SET <column name> = <value expression> { , <column name> = <value expression> }

[ WHERE <selection condition> ]

---

CREATE [ UNIQUE] INDEX <index name>

ON <table name> ( <column name> [ <order> ] { , <column name> [ <order> ] } )

[ CLUSTER ]

---

DROP INDEX <index name>

---

CREATE VIEW <view name> [ ( <column name> { , <column name> } ) ]

AS <select statement>

---

DROP VIEW <view name>

---

NOTE: The commands for creating and dropping indexes are not part of standard SQL.

# Summary

- Complex SQL:
  - Nested queries, joined tables (in the FROM clause), outer joins, aggregate functions, grouping
- **CREATE VIEW** statement and materialization strategies
- Schema Modification for the DBAs using **ALTER TABLE** , **ADD** and **DROP COLUMN**, **ALTER CONSTRAINT** etc.
